

## Project 4:

### **Personal Objective:**

To focus more on front end (CSS and React components).

### **Problem statement:**

When people plan for travel, they will have to save their itinery everywhere (word, paper, etc). There is no centralized place to save their itinery and edit the itinery.

### **User story 1:**

I am a non-frequent traveler. I would like to plan for my free and easy trip to another country and it is abit difficult for me to plan for. I have saved many websites and locations, it however, I don't have aplace to consolidate it. Using words is a hassle with formatting.

### **User story 2:**

I have a frequent traveller, however when I re-visit places, I would like to change some itineries, from the past, but I don't have a good place that I have stored all the information.

### **User story 3:**

I have itineries from my friends and I would like to compare and use the itinery/parts which suits my travel requirement, but their formatting are different, difficult to see the timings for each travelling and/or activities.

### **Solution:**

This app will help the user to be able to save details and where and what has been planned for the day/days.

After log in:

<div>=</div> <div>Home</div> <div>Add New</div> <div>Log Out</div>	<div>Welcome back! &lt;enter user name here&gt;</div>
	<div>If there is no destination: Add a new destination!</div>
	<div>Country &amp; city name.</div>
	<div>Country &amp; city name.</div>

When click into a new particular destination;

<div>=</div>	<div>Country &amp; City – Planned x days</div>
	<div>Day 0</div>
	<div>&lt;Activity/Travelling&gt; Time &amp; description</div>
	<div>&lt;Activity/Travelling&gt; Time &amp; description</div>
	<div>Day 1</div>
	<div>&lt;Activity/Travelling&gt; Time &amp; description</div>

When click on adding new:

<div>=</div>	<div>Please enter the country/ City Name</div>	
	<div>Start of day x</div>	<div>Add</div>
	<div>End of day x</div>	<div>Add</div>
	<div>Activity: Description: Notes: URL:</div>	<div>Add</div>
	<div>Day 0</div> <div>&lt;Activity/Travelling&gt; Time &amp; description</div>	<div>↑↓</div> <div>↑↓</div>
		<div>Save</div>

If I have the time for **further**, I will be adding the below:

- 1) Share function to another user for a destination.
- 2) Print as PDF function for convenient carrying around.

The ERD Table:
